CUTTING EDGE OF  
TRANSPLANTATION

AST | AMERICAN SOCIETY OF  
TRANSPLANTATION

**RESOLVING THE ORGAN SHORTAGE**

PRACTICE |

POLICY |

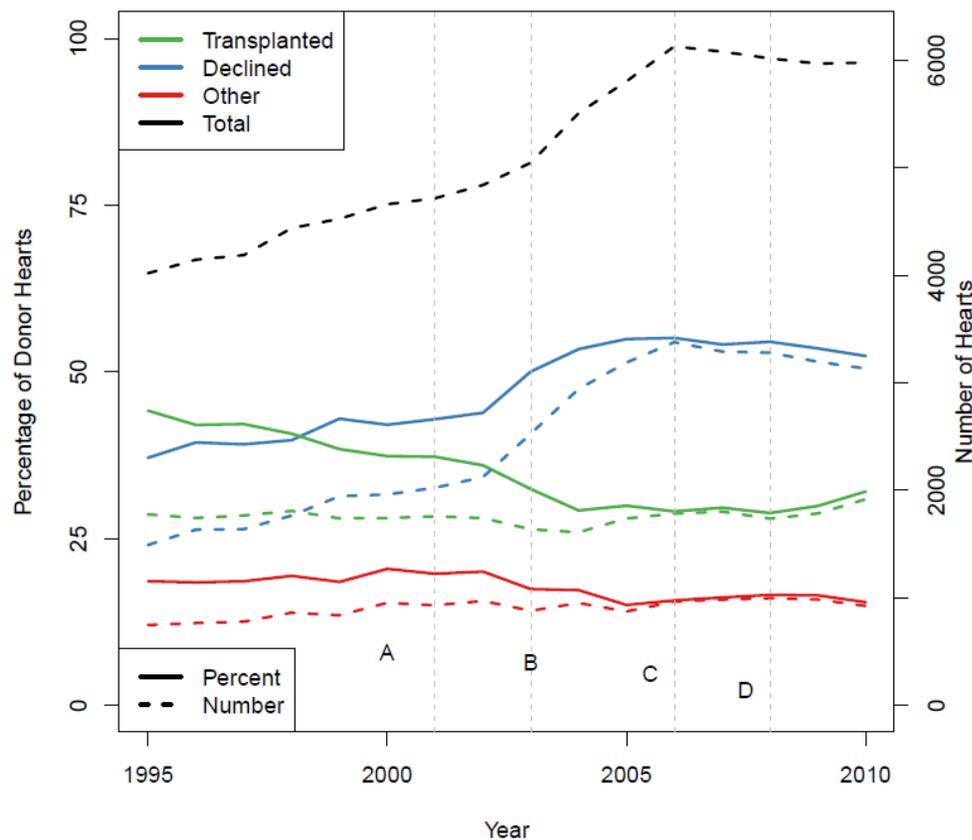

POLITICS

FEBRUARY 25-27, 2016 • PHOENIX, ARIZONA

# Conflict of Interest Disclosure

- Grant Funding
  - NIH (NHLBI, R01)
  - American Heart Association
- CareDx, Inc: consultant, advisory board, speakers' bureau

# Decline in donor heart utilization nationwide

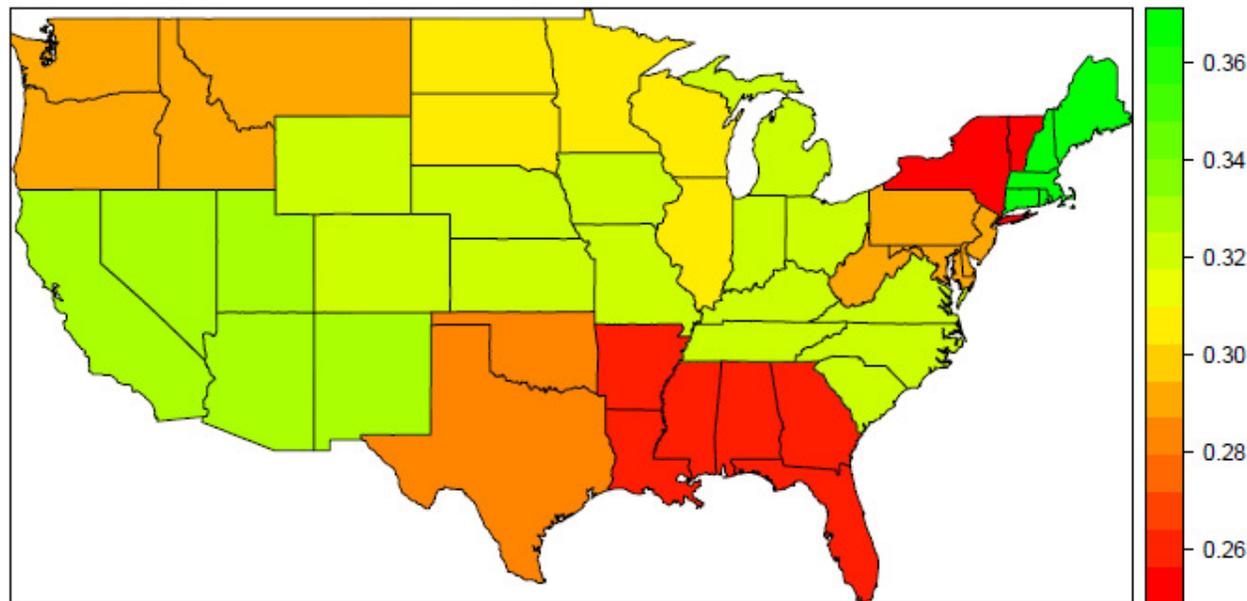

SRTR data 1995-2010,  
All DNDD donors aged 14-70  
years

- High: 44% in 1995
- Low: 29% in 2006
- Current: 32%
- Waiting time has increased by 3.5 months for status 1B and 9.3 months for status 2 recipients.

# Regional variability in donor heart acceptance for transplant

Percentage of Hearts Transplanted  
2006–2010

Khush K, Am J Transplantation, 2015

# Advantages of having a risk score

---

- Tool that can be used “real time” for decision-making during an organ offer
- Applies evidence-based data, using donor and recipient risk factors, to predict transplant outcomes
- Standardize donor heart acceptance across the country
- Improve donor heart utilization

# Kidney Donor Risk Index (KDRI)

- Real-time tool that combines donor risk factors to summarize the risk of graft failure after kidney transplant
- A donor with a KDPI of 80% has a higher expected risk of graft failure than 80% of all kidney donors recovered last year
- Launched on-line and as an app

The screenshot shows the 'Kidney DPI' app interface. At the top, it displays 'Carrier' and '11:01 PM'. The title 'Kidney DPI' is centered, with an 'About' button on the right. Below the title is a green header for 'Donor Characteristics'. The form includes several input fields and toggle switches: Age (yrs) 40, Cr(mg/dL) 1, Weight(kg) 80, Height(cm) 170, DCD (NO), DM (NO), HTN (NO), HCV (NO), CVA (NO), and AA (NO). A blue header for 'Transplant Characteristics' is partially visible. Below this, the 'Donor Profile Index' is shown as 1.01 in a green box. At the bottom, there are two buttons: 'Set Defaults' and 'Est Graft Survival'.

# Liver Donor Risk Index (LDRI)

The screenshot shows a mobile application interface for the Liver Donor Risk Index (LDRI). The status bar at the top indicates 'Carrier', signal strength, Wi-Fi, and the time '12:38 AM'. The app title is 'Liver DRI' with an 'About' button. The main heading is 'Enter Donor Characteristics:'. The form includes the following fields and options:

- Age (yrs):** Below 40, 40-50, 50-60, 60-70, Above 70
- Height:** enter height(cm)
- Cause of Death:** Trauma, Stroke, Anoxia, Other
- Graft Type:** Stndrd, Prtl/Splt, DCD
- Race:** White, Black, Other
- Cold Ischemia Time:** 1 hour (dropdown)
- Donor Location:** Local, Regional, Nat'l

At the bottom, there is a button labeled 'Estimate Graft Survival' and a result display showing 'Donor Risk Index 1.00'.

# How do we combine donor and recipient risk?

---

Low risk donor:  
Low risk recipient

High risk donor:  
High risk recipient

High risk donor:  
Low risk recipient

Low risk donor:  
High risk recipient

# High risk donor: High risk recipient

---

## PRO

- Offer a heart that may have been discarded to a recipient who otherwise may not have been eligible for transplant
- Use “marginal” donor hearts for sickest patients, since they are likely to have a survival benefit, even though post-transplant outcomes may be sub-optimal

## CON

- Transplanting a high-risk donor heart into a high-risk recipient may be considered an irresponsible accumulation of risk with a high likelihood of patient death after transplant.

# High risk donor: Low risk recipient

---

## PRO

- Higher likelihood of graft survival

## CON

- Placing our “best” candidates at a disadvantage?
- Reducing long-term survival

# Balancing Risk: Impact of Transplant Center Volume

---

Does institutional volume impact outcomes after HTx using marginal donor hearts?

- UNOS registry analysis, N=3200, 2000-2010
- Identified marginal donors (>90<sup>th</sup> percentile in Weiss donor risk index)
- Stratified into tertiles based on transplant center volume (<14, 14-25, >25)
- Examined post-transplant outcomes

Kilic, Ann Thorac Surg, 2012

# Impact of transplant center volume

---

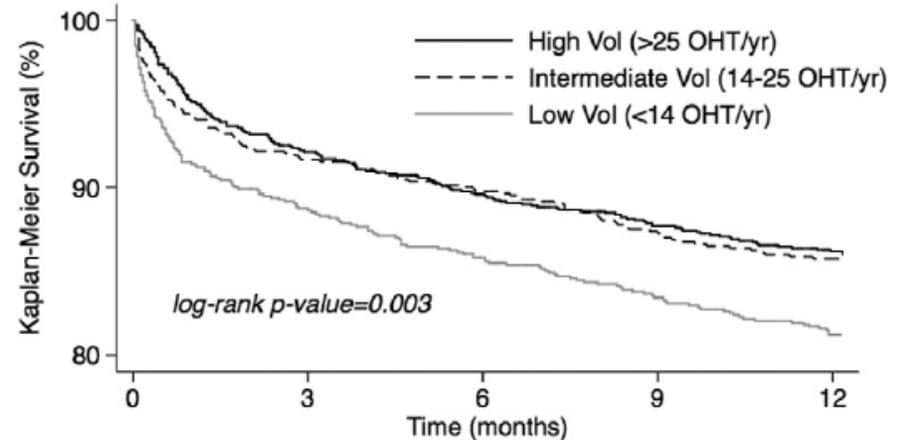

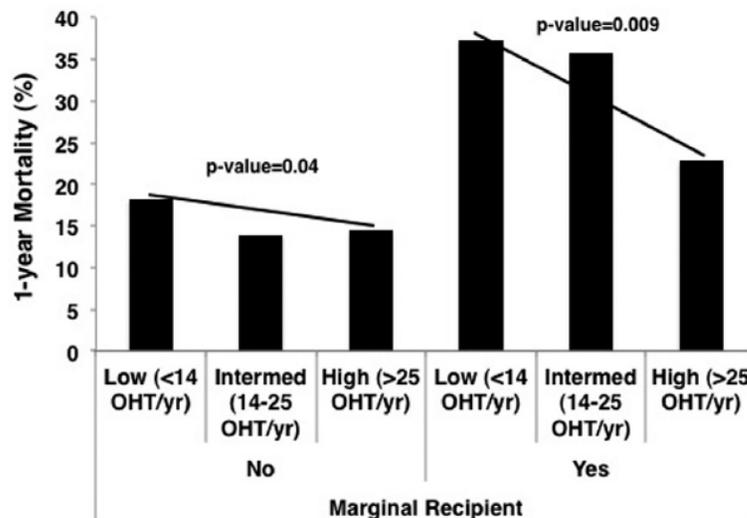

## Marginal vs. Standard Donors

- Recipients of marginal donor hearts were higher risk than recipients of standard donor hearts (IMPACT score 6.2 vs 5.6,  $p < 0.001$ )
- A higher proportion of HTxs at high volume centers was performed using a marginal donor (high 22.4%, low 16.2%)
- High-volume centers had highest average donor risk index

Kilic, Ann Thorac Surg, 2012

# Impact of transplant center volume

Impact of center volume on 1-year mortality in marginal recipients

1-year survival

# Balancing Risk: Impact of transplant center volume

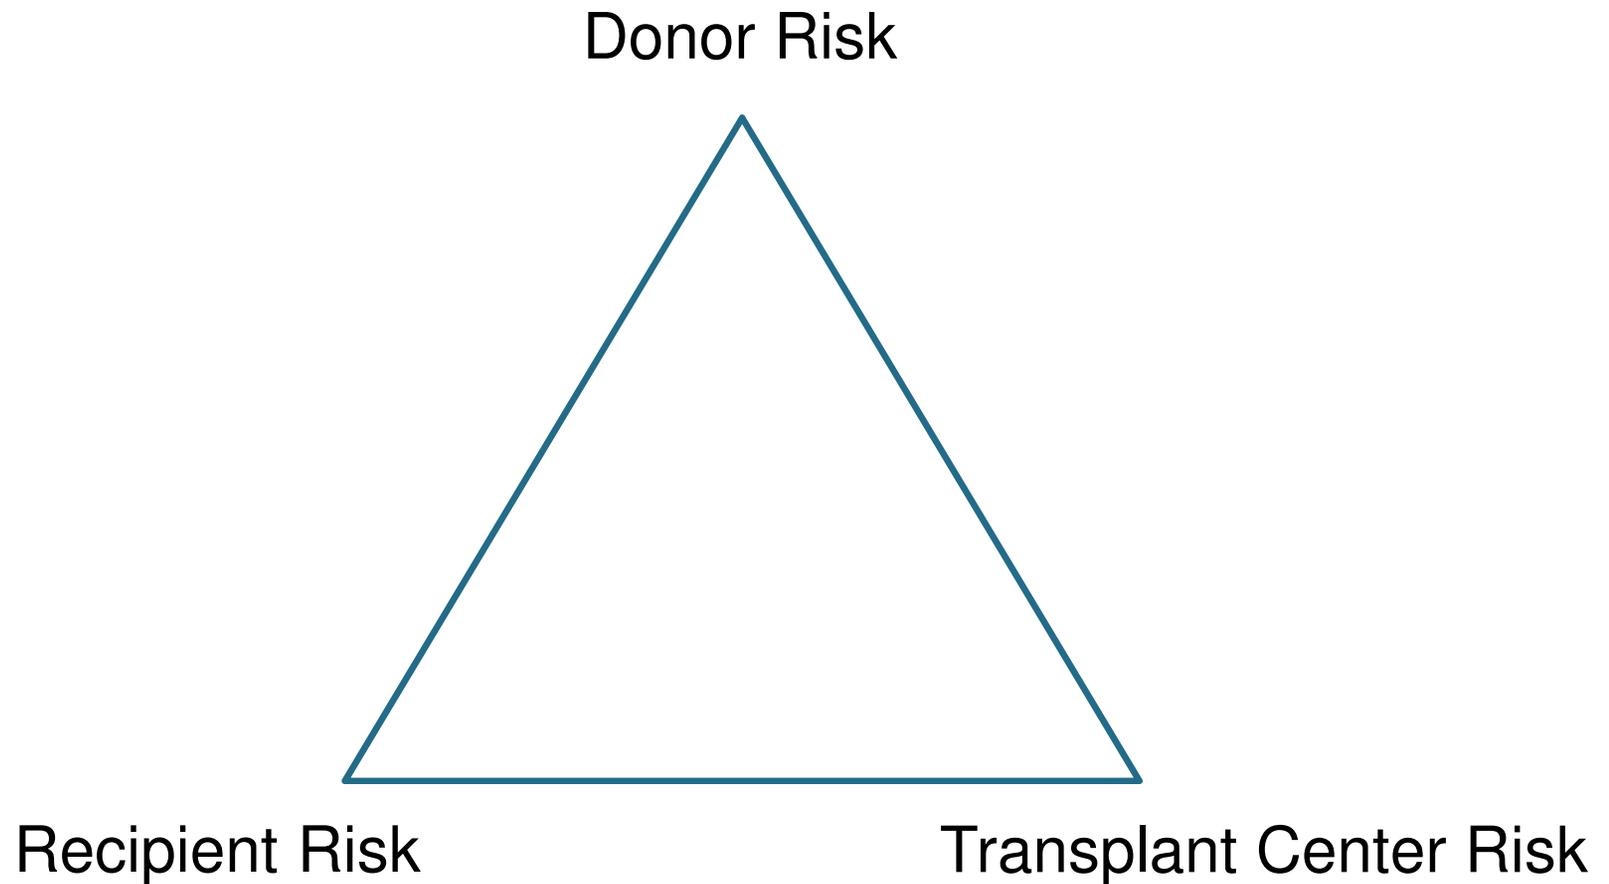

---

## Conclusions

- Marginal donor heart transplants are more complex (higher donor risk, higher recipient risk, higher complication rates)
- Transplant center experience plays an important role
  - Experienced personnel
  - Experience selecting marginal hearts (e.g. older donors with short ischemic time)
  - Standardized clinical pathways
  - Dedicated ICU and ancillary staff

# Balancing Risk

---

# Looking forward

---

- High-risk transplants should ideally be performed at high-volume centers.
- Introduction of a risk stratification scheme may prevent penalizing centers that transplant higher risk donors and recipients by accounting for case mix in quality and reimbursement measures.
- Rigorous, high-quality data required to develop a real-time risk score incorporating donor- and recipient-specific variables are lacking

## Evidence-Based Evaluation and Acceptance of Donor Hearts for Transplantation

- Funded by National Institutes of Health
- 5-year prospective study
- 5,000 potential heart donors

PI: Kiran Khush, Stanford

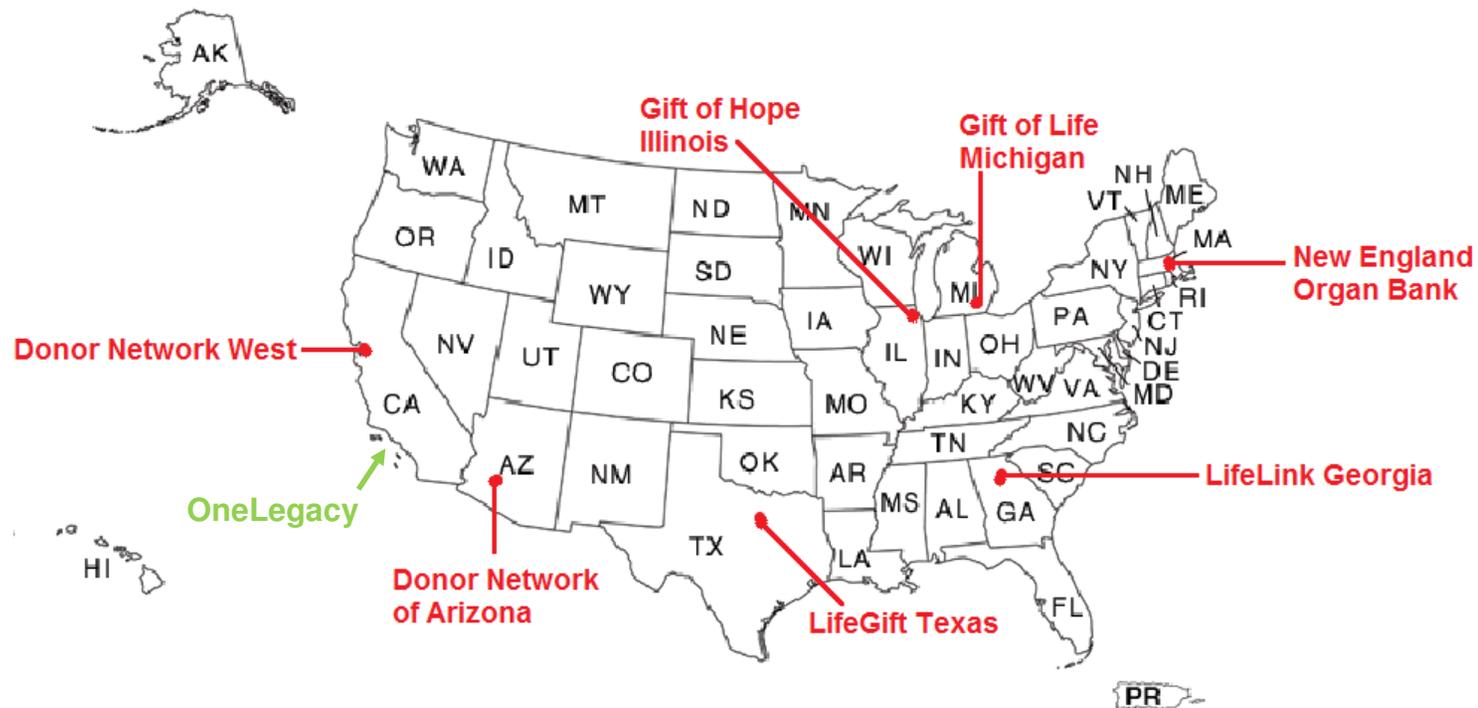

Co-I: Darren Malinoski, OHSU

Co-I: Jonathan Zaroff, KPSF

# Donor Heart Study

7 participating high-volume OPOs representing 6 UNOS regions

**Aim 1: To collect systematic data on cardiac structure and function in a nationally-representative cohort of potential heart donors**

- Serial ECG, Tnl, BNP during donor management
- Serial TTEs in donors with LV dysfunction (EF<50%) with core interpretation
- Data collection on donor heart acceptance

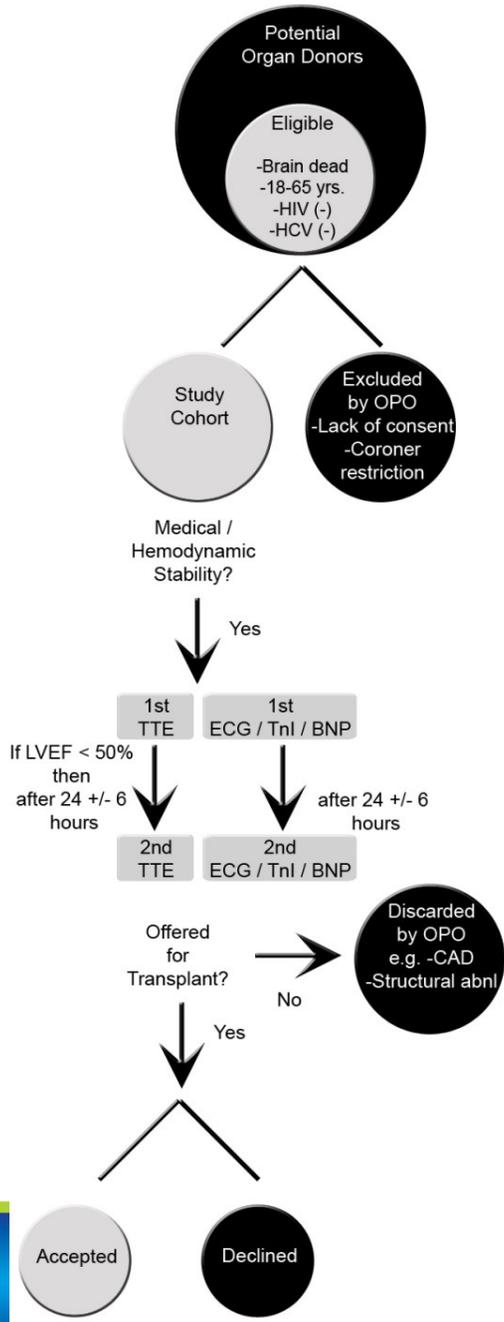

**Aim 1: To collect systematic data on cardiac structure and function in a nationally-representative cohort of potential heart donors**

## Study Databases

- Stanford REDCap
- DMG Web Portal

STUDY PROTOCOL

# Aim 2: To collect real-time detailed data on reasons for donor heart non-acceptance

## APPENDIX D.2.a: DONOR HEART NON-ACCEPTANCE SURVEY (for hearts declined by transplant center)

Date: \_\_\_\_\_ Time: \_\_\_\_\_ Transplant Center: \_\_\_\_\_ Donor UNOS ID: \_\_\_\_\_

Potential transplant recipient number: \_\_\_\_\_ Sequence/Rank No. \_\_\_\_\_

Offer made to:  Surgeon  Surgical Fellow  Cardiologist  Cardiology Fellow  NP  Nurse Coord.

Survey Completed by:  Surgeon  Surgical Fellow  Cardiologist  Cardiology Fellow  NP  Nurse Coord.

Directions: Check all reasons that apply for donor heart declination.

<p><b>RECIPIENT ISSUES</b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Recipient: <input type="checkbox"/> ill <input type="checkbox"/> unavailable <input type="checkbox"/> declined</li> <li><input type="checkbox"/> Recipient already transplanted</li> <li><input type="checkbox"/> Recipient's condition improved, transplant not needed</li> <li><input type="checkbox"/> Multiple organ transplant</li> <li><input type="checkbox"/> Recipient declined due to high risk donor</li> <li><input type="checkbox"/> Medical urgency of another potential recipient</li> <li><input type="checkbox"/> Other (specify): _____</li> </ul>	<p><b>DONOR ISSUES</b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Donor age</li> <li><input type="checkbox"/> Gender <input type="checkbox"/> Male <input type="checkbox"/> Female</li> <li><input type="checkbox"/> Height disparity</li> <li><input type="checkbox"/> Weight disparity</li> <li><input type="checkbox"/> Public Health Service (PHS) high risk: <input type="checkbox"/> HIV <input type="checkbox"/> Hep B <input type="checkbox"/> Hep C <input type="checkbox"/> IV Drugs <input type="checkbox"/> Hemodialysis <input type="checkbox"/> Other: _____</li> <li><input type="checkbox"/> Social hx: <input type="checkbox"/> Jail/prison <input type="checkbox"/> Hx of STDs <input type="checkbox"/> Behavior risk <input type="checkbox"/> Unobtainable <input type="checkbox"/> Other: _____</li> <li><input type="checkbox"/> Drug Usage <input type="checkbox"/> Meth <input type="checkbox"/> Cocaine</li> <li><input type="checkbox"/> Alcohol Abuse</li> <li><input type="checkbox"/> Donor instability (high pressor requirement: agent &amp; dose _____)</li> <li><input type="checkbox"/> Surgical damage to organ</li> <li><input type="checkbox"/> Trauma to organ</li> <li><input type="checkbox"/> Organ preservation</li> <li><input type="checkbox"/> Organ anatomical damage/defect</li> <li><input type="checkbox"/> ECG: <input type="checkbox"/> LVH <input type="checkbox"/> Ischemia <input type="checkbox"/> prolonged QTc <input type="checkbox"/> Other: _____</li> <li><input type="checkbox"/> ECHO: <input type="checkbox"/> LVH: _____ cm Low EF: _____ % <input type="checkbox"/> Other: _____</li> <li><input type="checkbox"/> Cath/Angiogram <input type="checkbox"/> CAD <input type="checkbox"/> PHTN <input type="checkbox"/> PA pressure _____ <input type="checkbox"/> PCWP _____ <input type="checkbox"/> Other: _____</li> <li><input type="checkbox"/> Medical History <input type="checkbox"/> Diabetes <input type="checkbox"/> Hypertension <input type="checkbox"/> Other: _____</li> <li><input type="checkbox"/> Elevated biomarkers (Troponin, CKs)</li> <li><input type="checkbox"/> Donor infection</li> <li><input type="checkbox"/> Cardiac downtime (time: _____)</li> <li><input type="checkbox"/> Insufficient information (i.e. cath or echo not available; specify: _____)</li> <li><input type="checkbox"/> Cause of death (specify): _____</li> <li><input type="checkbox"/> Offer not made due to expedited placement attempt</li> <li><input type="checkbox"/> Other: _____</li> </ul>

<p><b>OTHER</b></p> <ul style="list-style-type: none"> <li><input type="checkbox"/> Specify: _____</li> </ul>	

**Aim 3: To develop clinical tools to assist transplant centers with real-time decisions about donor heart acceptance**

- Risk models for recipient outcomes, given donor and recipient characteristics at the time of an organ offer

# Sample Donor Heart Report

## Donor Characteristics:

Age	Gender	Cause of Death
45	Male	Stroke

## Donor Health:

Hypertension	Diabetes	Coronary Artery Disease
No	Yes	No

## Echo Results:

Ejection Fraction	Regional Wall Motion Abnormalities	Left Ventricular Hypertrophy
58%	No	Yes

A heart with these characteristics has been transplanted **83%** of the time. **97%** of patients with a similar heart survive at least 30 days and **92%** survive 1 year. It is expected that you would have to wait on average **6 months** to be offered a more desirable heart.

# Study Goals

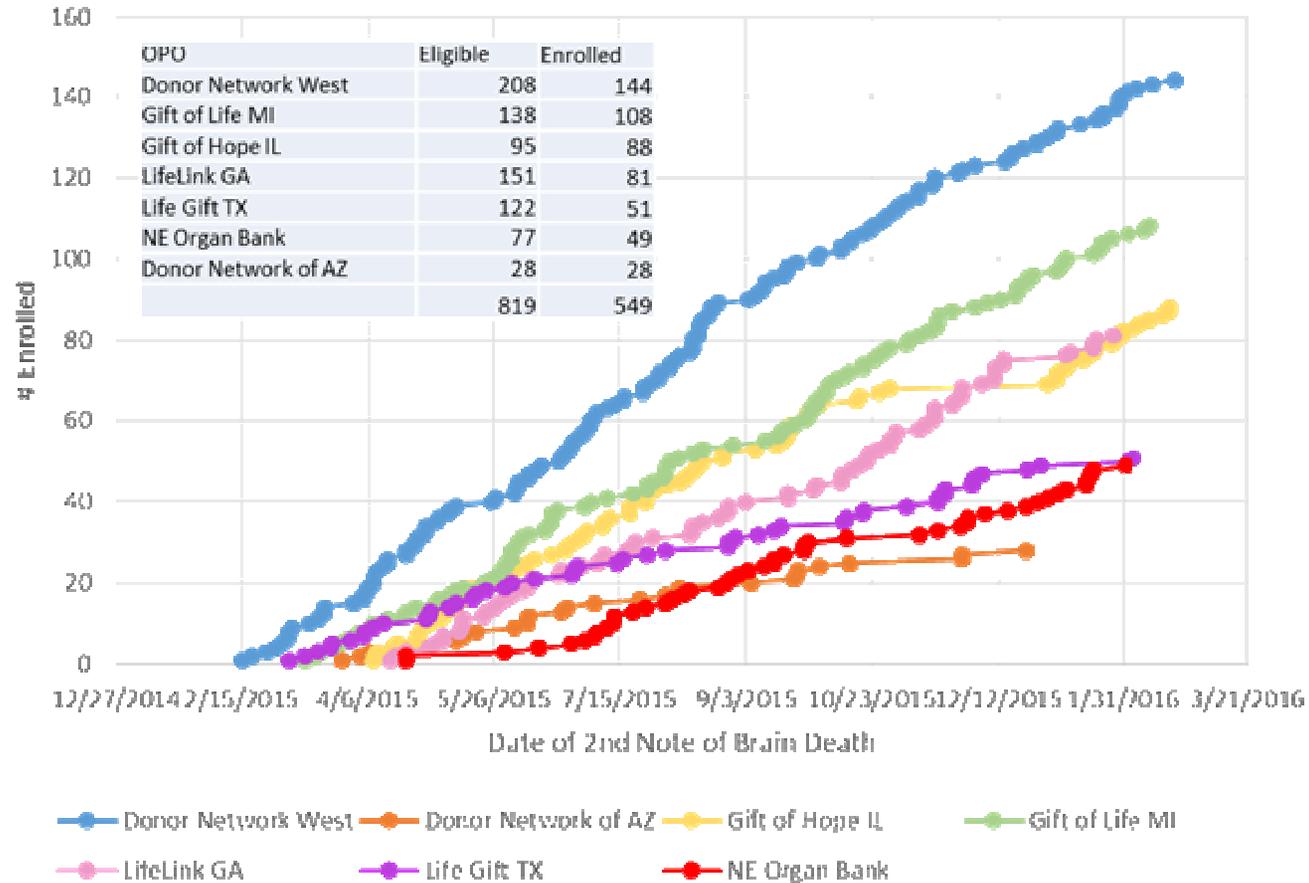

- Standardized data collection on donor characteristics nationwide
- To study prevalence and reversibility of cardiac dysfunction after brain death
- To identify biomarkers that define organ quality
- Detailed examination of current donor heart acceptance practices
- To identify donor predictors of recipient outcomes
- To develop tools that can be used real-time in decision making for donor heart acceptance

# Donor Heart Study

Enrollment v. Time
